

METHOD AND STRUCTURE TO ANALYZE WEB CLIENT DIALOGS

ABSTRACT

5 A method (and structure) of capturing dialog on a computer network includes, based on an initial access request to a first network node, establishing contact with an intermediary node so that a subsequent dialog is directed through the intermediary node. A request inbound to the first network node is directed to the intermediary node. A response outbound from the first network node that responds to the inbound request is also directed to the intermediary node.
